FRONTEND PLATFORM ENGINEER

PLATFORMS TEAMS CAN INHERIT Builds shared frontend infrastructure and developer tooling from recurring product problems, then earns adoption through clear contracts, supported paths, and production ownership.

8 teams / 50+ engineers

Cross-team technical direction

1,000+ practitioners

Shared platform adoption and support

One-third of peak

Request traffic and delivery cost

EXPERIENCE

State Farm Insurance

Enterprise Technology / Digital Experience / statefarm.com

Senior Software Engineer | Digital Experience Platform Lead

Mar 2026 – Present

Official State Farm title: Senior Technology Engineer

- Promoted to set frontend and customer-experience direction across **8 product teams and 50+ engineers** without reporting authority; partner with design, product, platform, identity, accessibility, and mobile leaders.
- Built an **AI-assisted Figma-to-code workflow** with Figma MCP, live docs, focused skills, deterministic checks, and human approval; cut one representative page build from about **two weeks to one day**.
- Built a RAG context service with document ingestion, vector retrieval, and MCP, then **retired it after measurement** showed live docs, thin skills, and deterministic checks matched its results with less infrastructure and drift.
- Introduced a Node.js and **Declarative Shadow DOM** sidecar to server-render and hydrate SFDS Web Components in AEM content-fragment pages without replacing CMS authoring.
- Reworked CloudFront and npm delivery with tiered caching, content-hashed assets, and selective CI invalidation; cut request traffic and delivery cost to about **one-third of peak** with RUM, rollback controls, and production support.
- Mentored **5+ engineers through progression to Lead** and **3 through progression to Lead II** through coaching, architecture review, and scope planning.

Lead Software Engineer I → II | State Farm Design System

May 2023 – Mar 2026

- Architected **sf-ui**, a framework-agnostic Lit/Web Components platform with accessibility built into **70+ primitives**, used by **1,000+ engineers and designers** across React, Angular, AEM, and legacy stacks.
- Built the platform around the components: a TypeScript Figma-to-W3C token pipeline, versioned docs, npm/CDN delivery, release policy, observability, and production support. Earned adoption through research, six pilots, office hours, migration support, and a champion network.

Software Engineer / Software Development Co-op | Telematics + Platform Services

May 2020 – May 2023

- Built React applications and microfrontends, Node.js APIs on AWS Lambda, and Java/Kafka services for asynchronous telematics enrollment and downstream account-state workflows.

SELECTED WORK

DesignRail / Open-source React/Apollo review layer for AI-assisted design-to-code; typed GraphQL preserves component intent and review decisions before export.

dibble / Published 11 portable Claude Code/Codex plugins and 12 skills for design systems, visual review, tool safety, and evidence tracing, backed by 148 tests and 95%+ line coverage.

Agent Convention Feedback Platform / Shipped an executive-requested AI feedback system in about two months; turned 800+ data-points from 197 participants into a source-linked interactive dashboard.

TECHNICAL RANGE

Frontend + design: TypeScript, React, Angular, Lit/Web Components, GraphQL/REST, SSR/hydration, AEM, Core Web Vitals, Figma/MCP, W3C design tokens, accessibility

Platforms + systems: Node.js, Java, AWS, Kafka, CDN/browser caching, auth/session flows, CI/CD, observability, agent tooling

EDUCATION

Utah State University / B.S. Computer Science, Magna Cum Laude, 3.9/4.0

Japanese-speaking volunteer leader, Fukuoka, Japan
